

Installation Guide

WHAPI Plus Inbox Plugin v1.0.0 | Plugin Manager v1.2

Development preview: This package supports registration and license activation. The complete Inbox runtime and automatic gateway upgrade are not yet available. Do not distribute it as a finished commercial release.

01 / Before you begin

Ensure WHAPI Plus and Plugin Manager v1.2 are installed, your website uses HTTPS, and you have a valid purchase code and the registered customer email. Back up your website and database.

02 / Upload the plugin

Sign in to the WHAPI Plus Admin Panel. Select **Plugins** in the sidebar, choose the original **plugin-source.zip** file, then click **Upload Plugin**. The plugin will appear under Installed Plugins.

The separate database-migration.sql is a development schema file. The current manager registers the package but does not automatically install its Inbox schema. Do not import it into production as part of this preview.

Activation & compatibility

03 / First-time activation

Click **Activate** beside WHAPI Plus Inbox. Enter your registered email and purchase code in the activation modal, then click **Verify & Activate**. The manager verifies the license with the Hajana One server over HTTPS.

04 / Deactivate and reactivate

An active plugin displays **Deactivate**. An inactive plugin displays **Activate**. After successful first-time verification, reactivation uses the saved verification record without requesting the purchase code again.

05 / Gateway compatibility (planned final release)

Gateway mode	Expected final-release behavior
Self-hosted	Automatic gateway upgrade and restart.
Compatible remote	Inbox works without a remote upgrade.
Incompatible remote	Plugin installs; Inbox remains unavailable until the gateway is upgraded or switched to self-hosted.

Troubleshooting

License verification failed: Check the registered email, purchase code and domain. The Inbox product must be uniquely published in Marketplace category 5, unless the vendor has configured its product ID.

Unrecognized package: Use the original, unmodified plugin ZIP. **Runtime unavailable:** This is expected in the development preview, even after successful activation.
